

MOASAS BASELINE REPORT

Illustrative sample · synthetic data
Observation period: 2026-05-01 to 2026-06-29 (60 calendar days)
Platform: Modular Optics And Sensor Array System – in-home passive monitoring

THIS REPORT CONTAINS NO REAL MEASUREMENTS.
Every value is synthetic, generated to exercise the report pipeline and to demonstrate its handling of missing data. It describes no person. It is published as a sample of the platform's reporting output only.

SUMMARY MEASURES

29.0°C MEAN DAILY TEMPERATURE range 27.8–30.5 · n=46	57.3% MEAN DAILY HUMIDITY range 49.1–62.7 · n=46	753 DAILY STEPS range 48–1,825 · n=54	407 MINUTES ASLEEP range 254–558 · n=23
14.8 AWAKENINGS PER NIGHT range 6–27 · n=23	49 bpm RESTING HEART RATE range 48–53 · n=18	19.4 SESSIONS PER DAY range 4–31 · n=48	35.3 min LONGEST SESSION range 8.0–63.6 · n=48

DATA COVERAGE

STREAM	DAYS	SPAN	COVERAGE	BASIS
Environmental (BME688)	46	60	77%	days at or above 50% minute sampling
Recorded sessions	48	60	80%	days with at least one recorded session
Wearable – any resolution	54	60	90%	daily activity totals present
Wearable – full resolution	23	60	38%	minute-level sleep and heart rate present

GAPS BY STREAM

STREAM	MISSING DATES
Environmental	2026-05-01 to 2026-05-13 (13d); 2026-06-29
Recorded sessions	2026-05-01 to 2026-05-11 (11d); 2026-06-29
Wearable (any)	2026-05-08 to 2026-05-11 (4d); 2026-06-05 to 2026-06-06 (2d)
Wearable (full)	2026-05-08 to 2026-05-27 (20d); 2026-06-05 to 2026-06-21 (17d)

METHODS AND LIMITATIONS

This document compiles measurements collected by an in-home sensor platform. It presents observations only. It contains no diagnosis, no clinical interpretation, and no assessment of severity. In this illustrative edition every value is synthetic.

Environmental data comes from a BME688 sensor logging once per minute with timestamps in ISO 8601 carrying an explicit UTC offset. Days below 50% minute-sampling completeness are excluded from statistics and marked in the daily record. The final day of any span is routinely truncated because the archive is pulled at 03:40 local time.

Sessions are video recordings triggered when the platform detects a person together with an associated object. The recorder holds for a fixed window after detection ends, which places a hard floor of 300 seconds on every session. A session at that floor indicates the trigger fired and nothing sustained followed; it is not evidence that an activity occurred. Session counts therefore function as presence sampling rather than activity counts, and recorded duration is a lower bound on true duration, because the trigger can fire after the activity has begun.

Wearable data comes from a wrist-worn consumer activity tracker, not clinical instrumentation. Sleep staging is inferred from movement and photoplethysmography rather than polysomnography. Reported oxygen saturation is a relative trend measure, not diagnostic oximetry. Skin temperature is measured at the wrist and is not core body temperature. Resting heart rate is a daily algorithmic estimate.

Sleep and cardiac figures are computed only over days at full resolution, because the device retains roughly seven days of minute-level detail and thirty days of daily totals in local storage; when upload is interrupted, fine-grained records are lost first. Mixing resolutions would silently average across two different instruments.

Every figure above states the number of days it was computed from. Missing days are shown as gaps. No value is interpolated or carried forward. Days marked `none`

carry no measurement and must not be read as zero activity. Only device-sourced records are used; account-level summaries are excluded, as they may aggregate data from other sources.
